## **Evolutionary Planning**

Producing even more in less time

EvoShort – AgileByExample2015

#### **Niels Malotaux**

- Team and Organizational Coach
- Expert in helping optimizing performance
- Helping projects and organizations very quickly to become
  - More effective doing the right things better
  - More efficient doing the right things better in less time Result Management
  - Predictable delivering as predicted
- Helping teams to shine

EvoShort – AgileByExample2015

Who is doing what?

- Developer ?
- Tester ?
- Architect ?
- Product Owner ?
- Scrum Master ?
- Team Member ?
- Customer ?
- Manager ?
- Consultant ?
- Coach ?

#### Who's responsible?

#### Everyone in the team !

#### **Universal Goal**

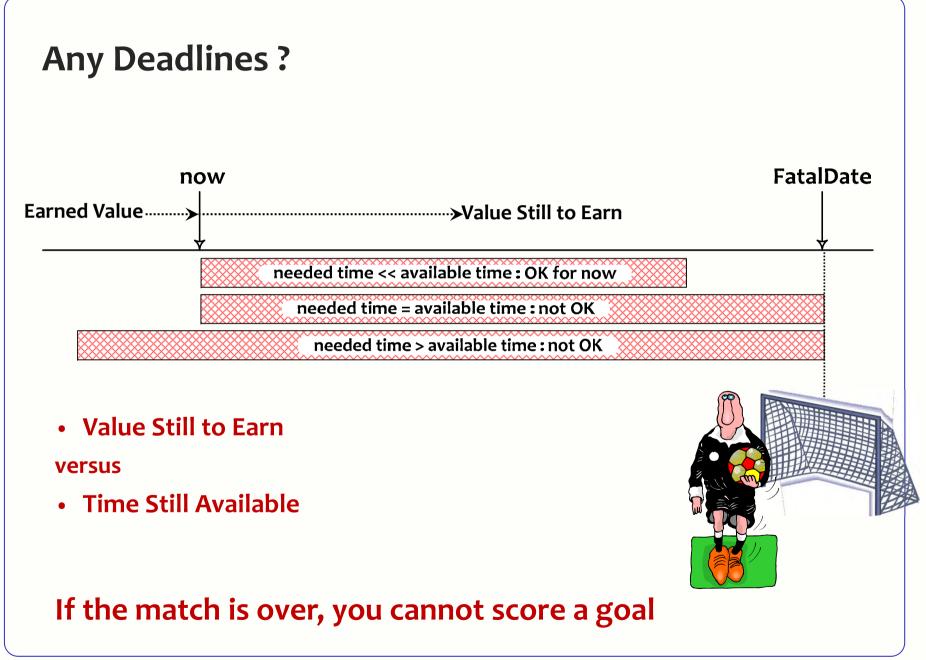

• Delivering the Right Result at the Right Time, wasting as little time as possible (= efficiently)

#### Providing the customer with

- what he needs
- at the time he needs it
- to be satisfied
- to be more successful than he was without it
- **Constrained by** (win win)
  - what the customer can afford
  - what we mutually beneficially and satisfactorily can deliver
  - in a reasonable period of time

#### Did you prepare ?

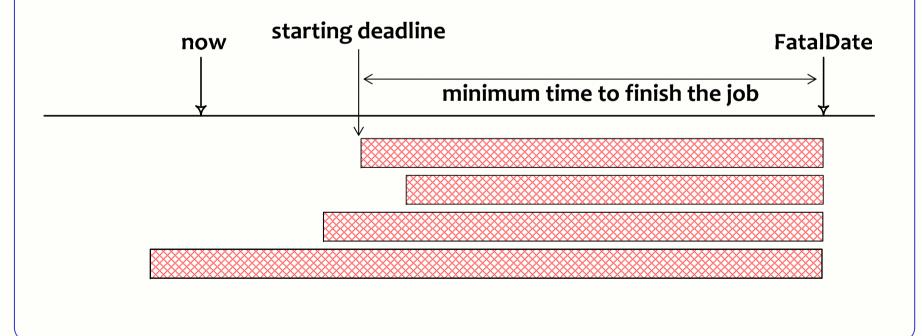

- The top-3 stakeholders of your work (Who is waiting for it?)
- The top-3 real requirements for your work (What are they waiting for?)
- How much value improvement the stakeholders expect (3 or 7?)
- Any deadlines (No deadlines: it will take longer)
- What you should and can have achieved in the coming 10 weeks (Will you succeed? Failure is not an option!)
- What you think you should and can do the coming week in order to achieve what you're supposed to achieve (Make sure not to plan what you shouldn't or cannot do At the end of the week everything you planned will be done)
- What value you will have delivered by the end of the week and how to prove it
- Any issues you expect with the above or otherwise with your work During the conference we can discuss more (e.g. at AskTheExpert sessions)

#### • Starting deadline

- Last day to start to make the finish deadline
- Every day we start later, we will end later

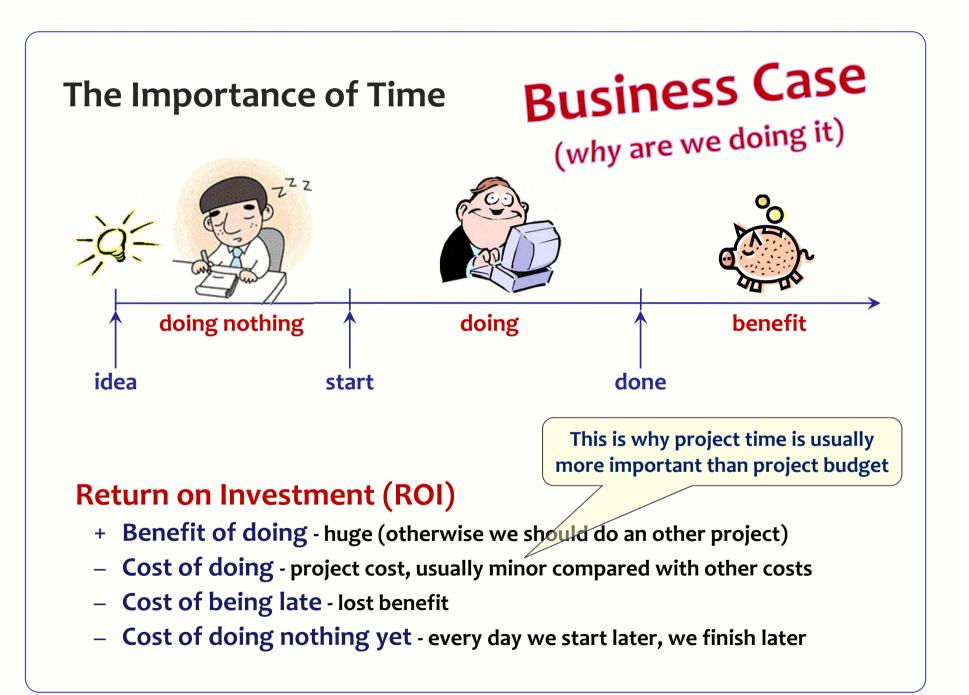

EvoShort – AgileByExample2015

What is the cost of one day of (unnecessary) delay?

- What is the cost of the project per day ?
- Do you know how much you cost per day? Note: that's not what you get !
- If you don't know the benefit, assume 10 times the cost of the project
- O<sup>th</sup> order estimations are good enough

- Do you know the benefit of your project ?
- Do you know the penalty for delay?

#### **Delivery time is a Requirement**

- Delivery Time is a Requirement, like all other Requirements
- How come most projects are late ???
  - Can Agile be late ?
- Apparently all other Requirements are more important than Delivery Time
- Are they really ?
- How about your current project ?

#### Did anyone tell you to go faster ?

- Produce more !  $\rightarrow$  bad quality  $\rightarrow$  produce less
- Produce quality !  $\rightarrow$  produce more

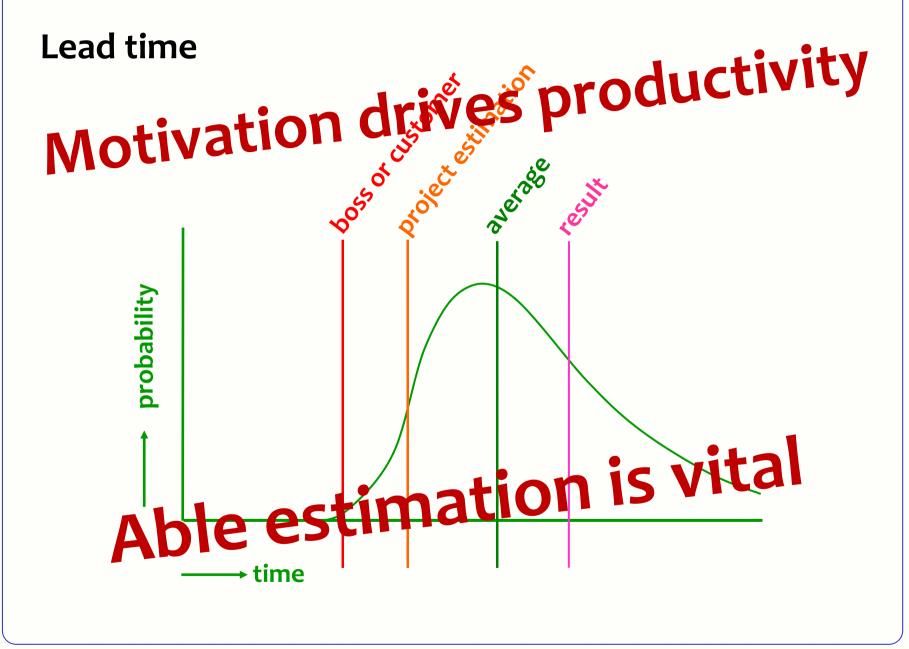

Quick delivery of a solution that doesn't work means no delivery

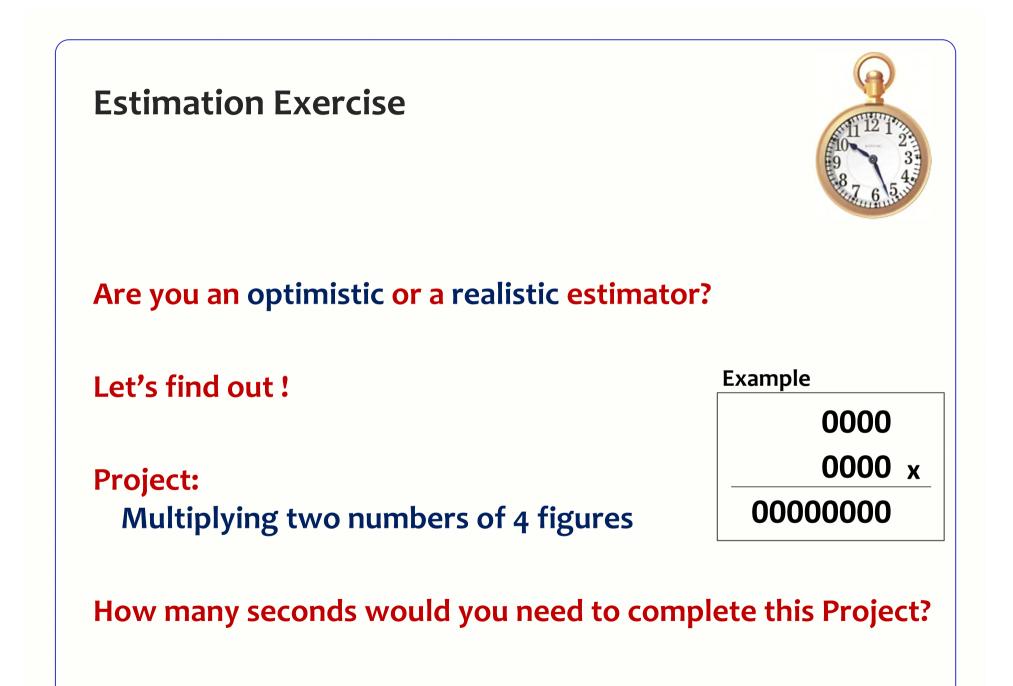

#### The problem is: it's counter-intuitive

#### The challenge

Failure is not an option

- Getting and keeping the project under control
- Never to be late
- If we are late, we failed
- No excuses
- Not stealing from our customer's (boss) purse
- The only justifiable cost is the cost of doing the right things at the right time
- The rest is waste
- Who would enjoy producing waste ?

EvoShort – AgileByExample2015

Is this what you did?

- Before test?
- After test?

Alternative Design (how to solve the requirement)

What was the real requirement?

Assumptions, assumptions ...

Better assume that many assumptions are wrong. Check !

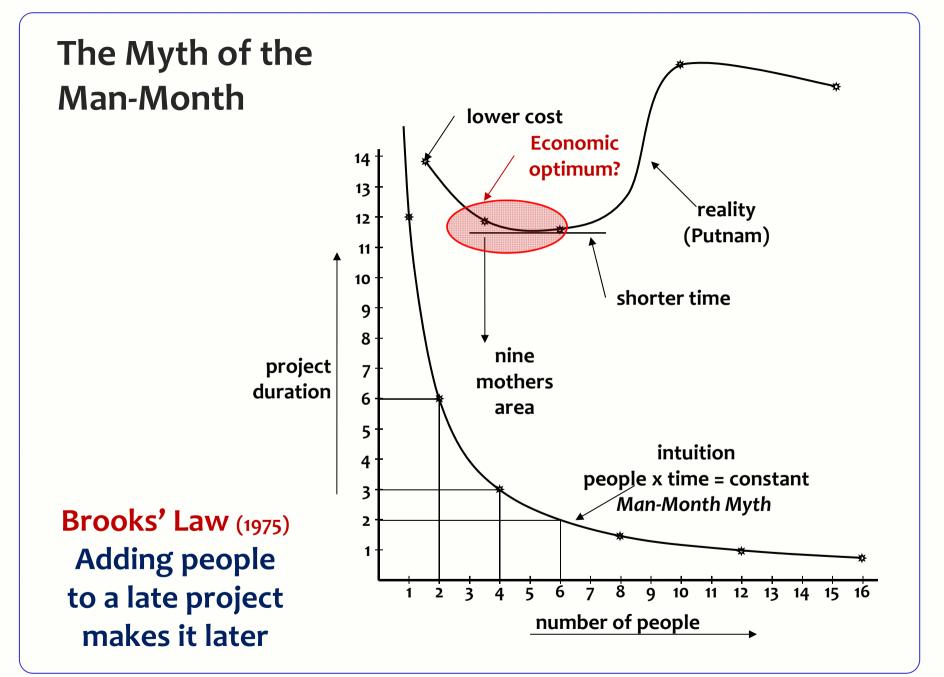

- Estimation, optimistic / realistic
- Interrupts
- Test, test strategy
- Defect-rate
- Design
- Requirements
- Real Requirements
- Assumptions

# How can we be On Time ?

#### Deceptive and difficult options to be on time

#### Deceptive options

- Hoping for the best (fatalistic)
- Going for it (macho)
- Working Overtime (fooling ourselves and the boss)
- Moving the deadline
  - Parkinson's Law
    - Work expands to fill the time for its completion
  - Student Syndrome
    - Starting as late as possible, only when the pressure of the FatalDate is really felt
- Difficult (but sometimes necessary) option
  - Adding people
  - Beware of Brooks' Law (1975)
    - Adding people to a late project ... makes it later

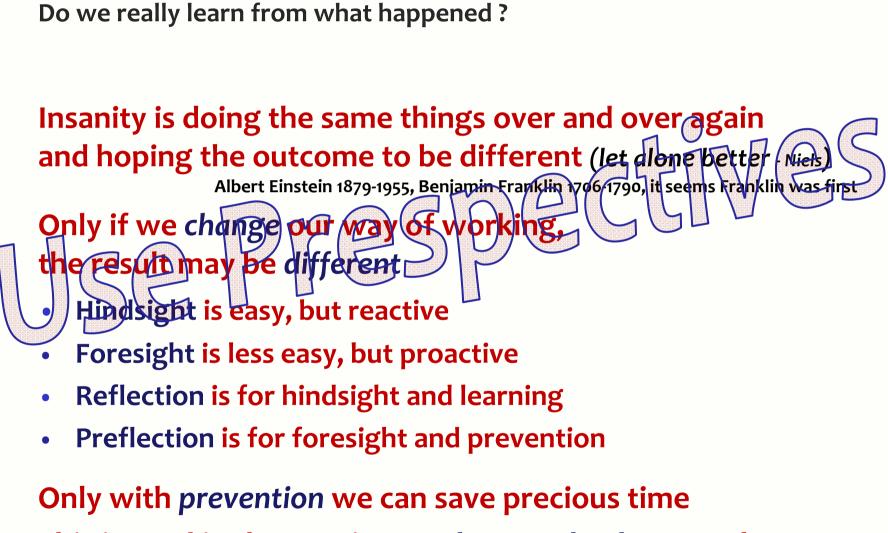

Continuous elimination of waste

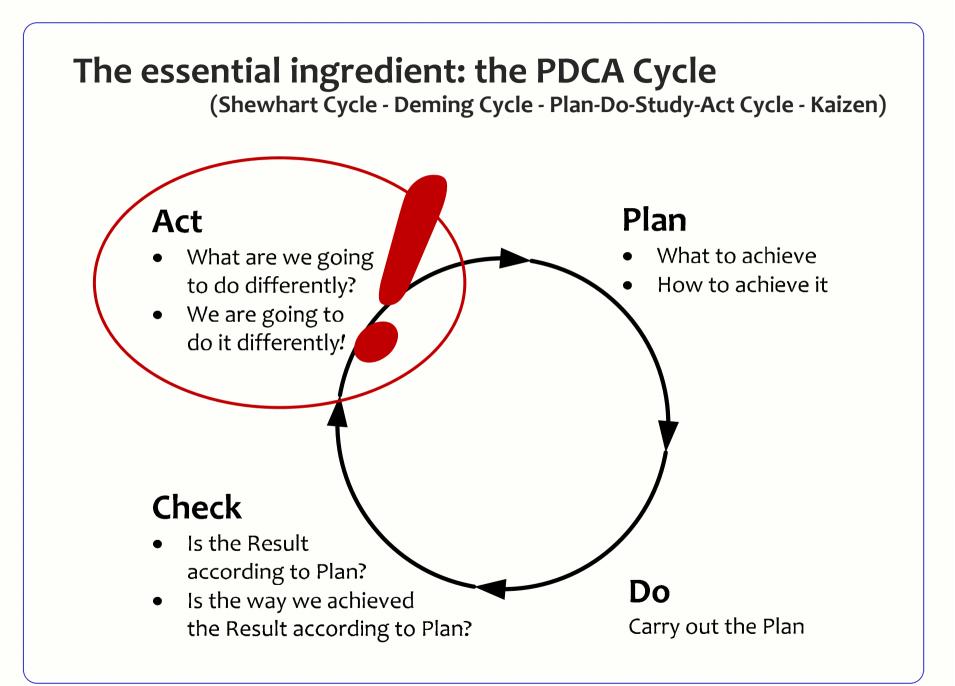

We don't have enough time, but we can save time without negatively affecting the Result !

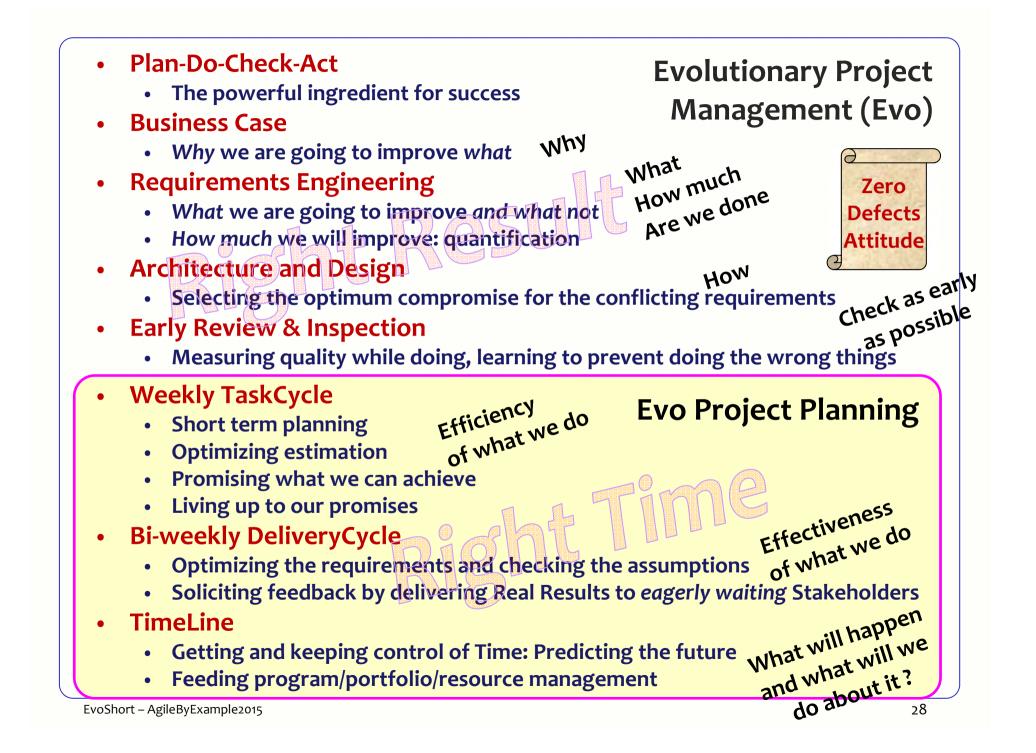

- Efficiency in what (why, for whom) we do doing the right things
  - Not doing what later proves to be superfluous
- Efficiency in how we do it doing things differently
  - The product
    - Using proper and most efficient solution, instead of the solution we always used
  - The project
    - Doing the same in less time, instead of immediately doing it the way we always did
  - Continuous improvement and prevention processes
    - Constantly learning doing things better and overcoming bad tendencies
- Efficiency in when we do it right time, in the right order
- TimeBoxing much more efficient than FeatureBoxing

**Do you use Retrospectives ?** 

This is used in the Deming or Plan-Do-Check-Act cycle

#### **Requirements have Rules**

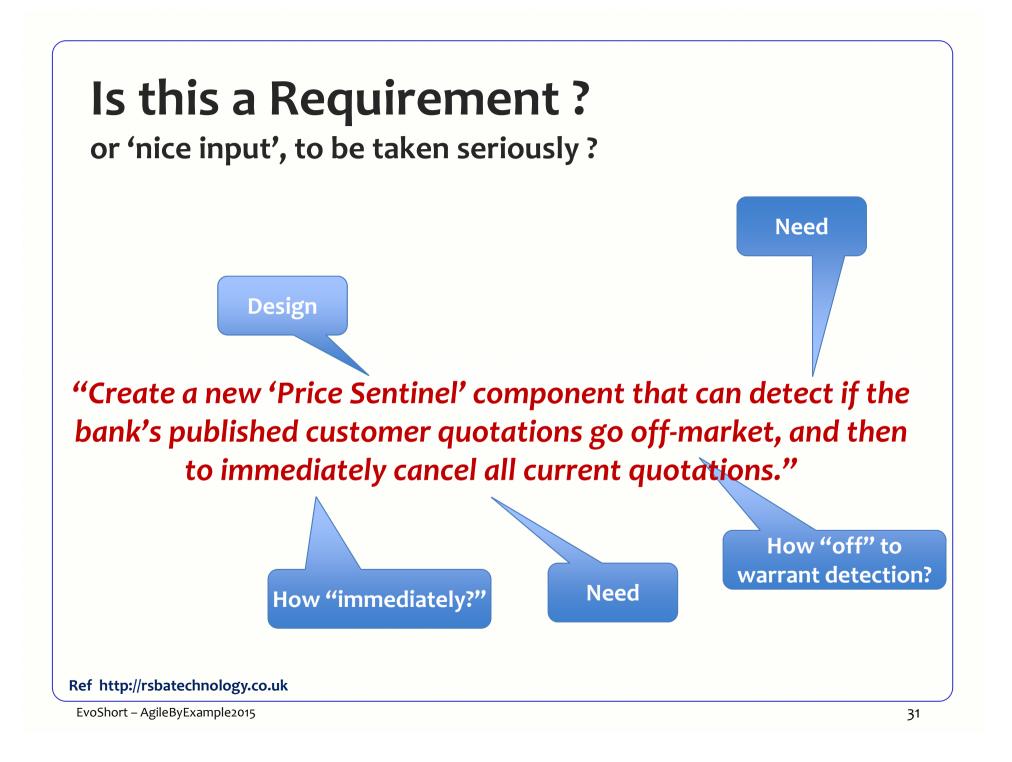

#### Some examples:

Rule 1: All quality requirements must be expressed quantitatively Rule 2: No design (solutions) in the requirements Rule 3: Unambiguous Rule 4: Clear to test

#### **Typical requirements found:**

- The system should be extremely user-friendly
- The system must work exactly as the predecessor
- The system must be better than before
- It shall be possible to easily extend the system's functionality on a modular basis, to implement specific (e.g. local) functionality
- It shall be reasonably easy to recover the system from failures, e.g. without taking down the power

Do you have examples of requirements?

### Using 5 Whys

Why do you need a "Price Sentinel"?

- 1. To prevent publishing off-market tradable prices
- 2. To prevent trading loss (having to buy at a higher price than the bank offered to the customer)
- 3. To demonstrate to senior management that e-trading business can safely (no unexpected loss) manage customer trading
- 4. To ensure that senior management will agree to expand e-trading business in the future, based on current business performance to other customer segments and business areas
- 5. To meet business medium / long-term financial targets

Ref http://rsbatechnology.co.uk

#### First try

#### New 'Price Sentinel' component:

- detect if the bank's customer quotations go off-market
- then immediately cancel all current quotations

#### • Off-market

- ?? Our margin less than 0.1% ?? Will have to investigate
- Cancelling all current quotations
  - Scale: seconds after <detection>
  - Current: 600 sec (10 min)
  - Goal: 1 sec

#### **Prioritize solutions by Impact Estimation Price Sentinel Kill button** Cancel 10.5 Sec (note) 1 sec 100% $600 \rightarrow 1 \text{ sec}$ 98% 1 day 30 day (6 sprint) Cost Note: 10 sec human recognition time, 0.5 sec cancel time

#### Tom Gilb quote

- The fact that we can set numeric objectives, and track them, is powerful; but in fact it is not the main point
- The main purpose of quantification is to force us to think deeply, and debate exactly, what we mean
- So that others, later, cannot fail to understand us

#### **Requirements with Planguage**

#### **Definition:**

Meter:

- **RQ27:** Speed of Luggage Handling at Airport Specific Scale:
  - Time between <arrival of airplane> and first luggage on belt
  - <measure arrival of airplane>, <measure arrival of first luggage on belt>, calculate difference

#### **Benchmarks (Playing Field):**

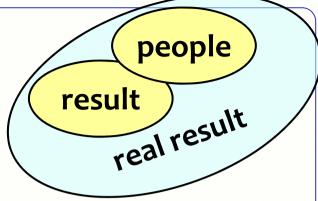

- 2 min [minimum, 2014], 8 min [average, 2014], 83 min [max, 2014] Past:
- **Current:** < 4 min [competitor y, Jan 2015]  $\leftarrow$  <who said this?>, <Survey Dec 2014>
- Record: 57 sec [competitor x, Jan 2012]
- Wish: < 2 min  $[2017Q3, new system available] \leftarrow CEO, 19 Jan 2015, < document ...>$

Time **Requirements:** Realizable **Tolerable:** < 10 min [99%, Q4]  $\leftarrow$  SLA **Tolerable:** < 15 min [100%, Q4, Heathrow T4]  $\leftarrow$  SLA < 15 min [99%, Q2], < 10 min [99%, Q3], < 5 min [99%, Q4] ← marketing Goal:

Measurable

Attainable

37

- Every project has some 30±20 Stakeholders
- Stakeholders have a stake in the project
- The concerns of Stakeholders are often contradictory
  - Apart from the Customer they don't pay
  - So they have no reason to compromise !
- Project risks, happening in almost every project
- No excuse to fail !

EvoShort – AgileByExample2015

#### No Stakeholder?

- No Stakeholder: no requirements
- No requirements: nothing to do
- No requirements: nothing to test
- If you find a requirement without a Stakeholder:
  - Either the requirement isn't a requirement
  - Or, you haven't determined the Stakeholder yet
- If you don't know the Stakeholder:
  - Who's going to pay you for your work?
  - How do you know that you are doing the right thing?
  - When are you ready?

#### Did anyone prepare ?

- The top-3 stakeholders of your work (Who is waiting for it?)
- The top-3 real requirements for your work (What are they waiting for?)
- How much value improvement the stakeholders expect (3 or 7?)
- Any deadlines (No deadlines: it will take longer)
- What you should and can have achieved in the coming 10 weeks (Will you succeed? Failure is not an option!)
- What you think you should and can do the coming week in order to achieve what you're supposed to achieve (Make sure not to plan what you shouldn't or cannot do At the end of the week everything you planned will be done)
- What value you will have delivered by the end of the week and how to prove it
- Any issues you expect with the above or otherwise with your work

#### **Exercise to create focus**

- The most important stakeholder of your work (Who is waiting for it?)
- The most important real requirement (What is (s)he waiting for?)
- How much value improvement does this stakeholder expect (3 or 7?)

• Was this the focus of your work the coming week?

# **Human Behavior**

#### **Human Behavior**

- Systems are conceived, designed, implemented, maintained, used, and tolerated (or not) by people
- People react quite predictably
- However, often differently from what we intuitively think
- Most projects
  - ignore human behavior,
  - incorrectly assume behavior,
  - or decide how people should behave (ha ha)
- To succeed in projects, we must study and adapt to real behavior rather than assumed behavior
- Even if we don't agree with that behavior

# Discipline

- Control of wrong inclinations
- Even if we know how it should be done ... (if nobody is watching ...)
- Discipline is very difficult
- Romans 7:19
  - The good that I want to do, I do not ...

- → Helping each other (watching over the shoulder)
- $\rightarrow$  Rapid success (do it 3 weeks for me...)
- → Making mistakes (provides short window of opportunity)
- → **Openness** (management must learn how to cope)

#### Intuition

- Makes us react on every situation
- Intuition is fed by experience
- It is free, we always carry it with us
- We cannot even turn it off
- Sometimes intuition shows us the wrong direction
- In many cases the head knows, the heart not (yet)
- Coaching is about redirecting intuition

#### Communication

- Traffic accident: witnesses tell their truth
- Same words, different concepts
- Human brains contain rather fuzzy concepts
- Try to explain to a colleague
- Writing it down is explaining it to paper
- If it's written it can be discussed and changed
- Vocal communication evaporates immediately
- E-mail communication evaporates in a few days

#### Perception

- Quick, acute, and intuitive cognition (www.M-W.com)
- What people say and what they do is not always the same
- The head knows, but the heart decides
- Hidden emotions are often the drivers of behavior
- Customers who said they wanted lots of different ice cream flavors from which to choose, still tended to buy those that were fundamentally vanilla
- So, trying to find out what the real value to the customer is, can show many paradoxes
- Better not simply believe what they say: check!

Excuses, excuses, excuses ...

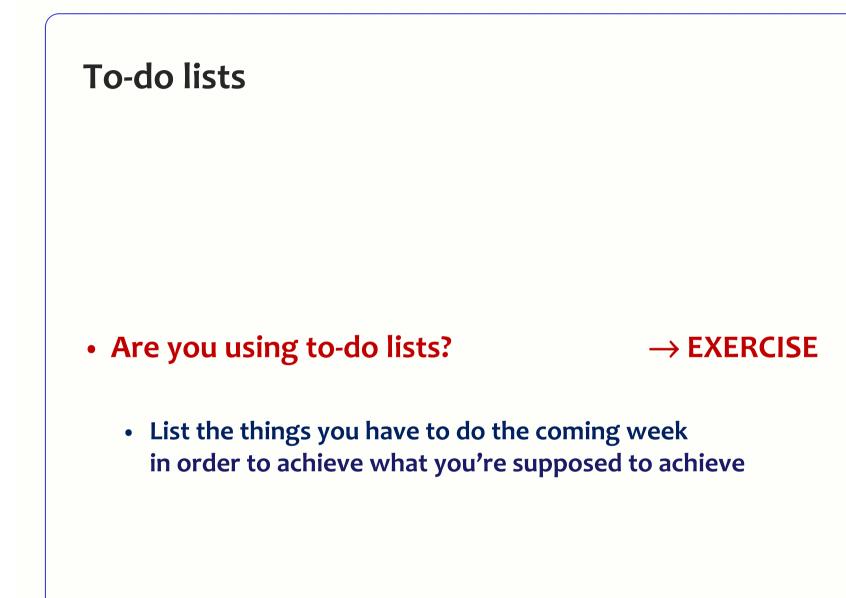

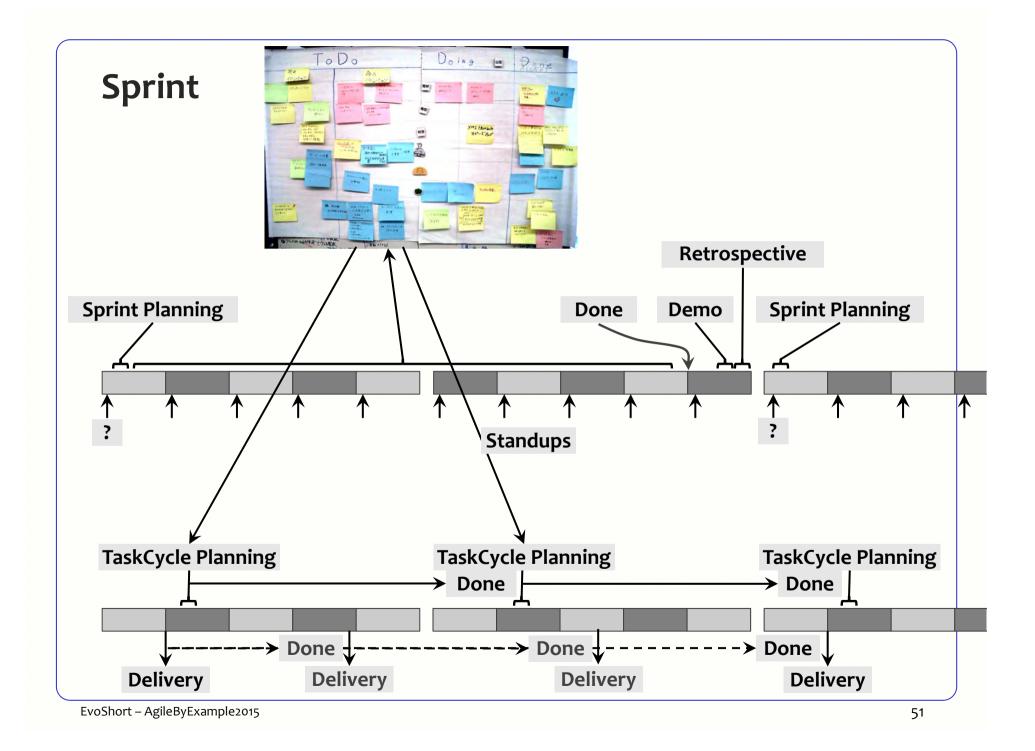

- We have been thoroughly trained to make excuses
- We always downplay our failures
- It's always 'them' How about 'us' ?
- At a Fatal Day, any excuse is in vain: we failed
- Even if we "really couldn't do anything about it"
- Failure is a very hard word. That's why we are using it !
- No pain, no gain
- We never say: "You failed" Use: "We failed"
  - After all, we didn't help the person not to fail

# Evolutionary Planning prevention is better than cure

#### Did anyone prepare ?

- The top-3 stakeholders of your work (Who is waiting for it?)
- The top-3 real requirements for your work (What are they waiting for?)
- How much value improvement the stakeholders expect (3 or 7?)
- Any deadlines (No deadlines: it will take longer)
- What you should and can have achieved in the coming 10 weeks (Will you succeed? Failure is not an option!)
- What you think you should and can do the coming week in order to achieve what you're supposed to achieve (Make sure not to plan what you shouldn't or cannot do At the end of the week everything you planned will be done)
- What value you will have delivered by the end of the week and how to prove it
- Any issues you expect with the above or otherwise with your work

## **To-do lists**

- Are you using to-do lists?
  - List the things you have to do the coming week
  - Did you add effort estimates?
  - Did you check how much time you have available the coming week?
  - Does what you have to do fit in the available time ?
  - Did you check what you can do and what you cannot do?
  - Did you take the consequence?

#### • Evo:

- Because we are short of time, we better use the limited available time as best as possible
- We don't try to do better than possible
- To make sure we do the best possible, we *choose* what to do in the limited available time. We don't just let it happen randomly

#### **Delivery Strategy Suggestions** (Requirements)

- What we deliver will be used by the appropriate users immediately, within one week not making them less efficient than before
- If a delivery isn't used immediately, we analyse and close the gap so that it will start being used (otherwise we don't get feedback)
- The proof of the pudding is when it's eaten and found tasty, by them, not by us
- The users determine success and whether they want to pay (we don't have to tell them this, but it should be our attitude)

#### Murphy's Law

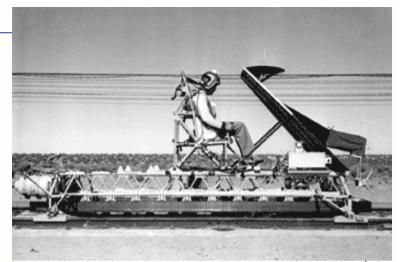

- Whatever can go wrong, will go wrong
- Should we accept fate ??

**Murphy's Law for Professionals:** 

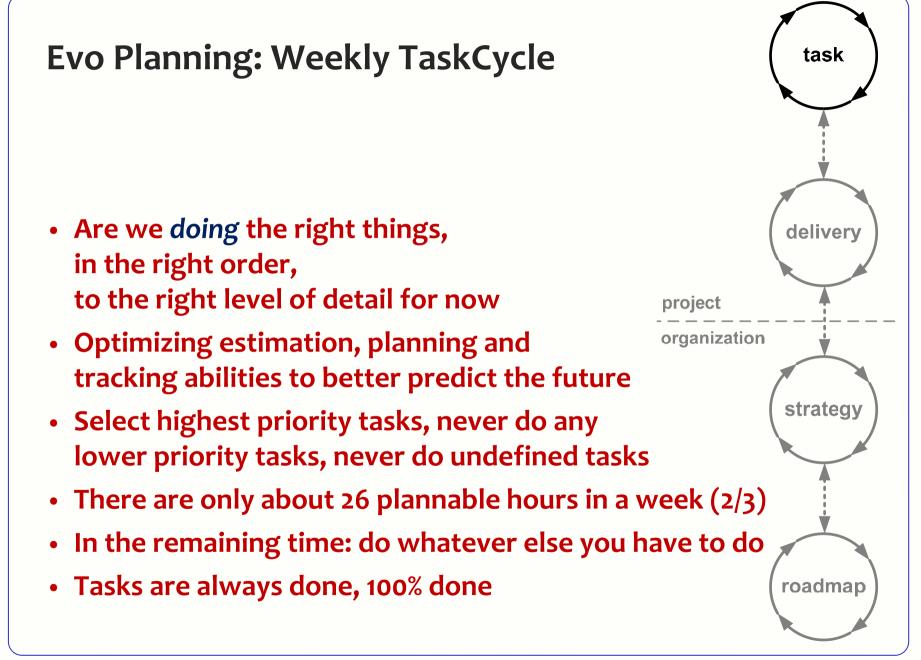

Whatever can go wrong, will go wrong ...

**Therefore:** 

We should actively check all possibilities that can go wrong and make sure that they cannot happen

55

- Days estimation  $\rightarrow$  lead time (calendar time)
- Hours estimation  $\rightarrow$  effort
- Effort variations and lead time variations have different causes
- Treat them differently and keep them separate
  - Effort: complexity
  - Lead Time: time-management
    - (effort / lead-time ratio)

#### Every week we plan

- How much time do we have available
- 2/3 of available time is net plannable time
- What is most important to do
- Estimate effort needed to do these things
- Which most important things fit in the net available time (default 26 hr per week)
- What can, and are we going to do
- What are we not going to do

2/3 is default start value this value works well in development projects

| _ | $\bigcirc$        |     | 1   |
|---|-------------------|-----|-----|
|   | <b>Task</b> a     | 2 , | ^   |
|   | Taskb             | 5   |     |
|   | Taskc             | 3   |     |
|   | Taskd             | 6   | do  |
|   | Task <sub>e</sub> | 1   |     |
|   | Taskf             | 4   |     |
|   | Taskg             | 5   | 26  |

| 5              |                  |     |     |

## Weekly 3-Step Procedure

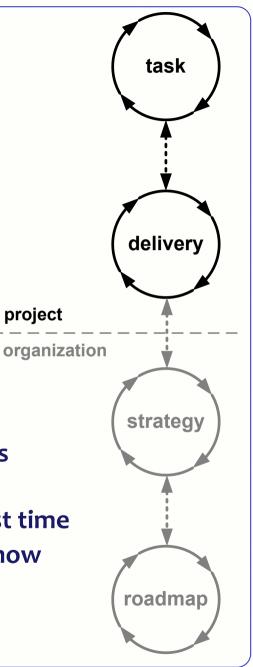

- Individual preparation
  - Conclude current tasks
  - What to do next
  - Estimations
  - How much time available
- Modulation with / coaching by Project Management (1-on-1)
  - Status (all tasks done, completely done, not to think about it any more ?)
  - **Priority check** (are these really the most important things ?)
  - Feasibility (will it be done by the end of the week ?)
  - Commitment and decision
- Synchronization with group (team meeting)
  - Formal confirmation (this is what we plan to do)
  - Concurrency (do we have to synchronize ?)
  - Learning
  - Helping
  - Socializing

EvoShort – AgileByExample2015

## DeliveryCycle

- Are we delivering the right things, in the right order to the right level of detail for now
- Optimizing requirements and checking assumptions
  - 1. What will generate the optimum feedback
  - 2. We deliver only to eagerly waiting stakeholders
  - 3. Delivering the juiciest, most important stakeholder values that can be made in the least time
  - What will make Stakeholders more productive now
- Not more than 2 weeks

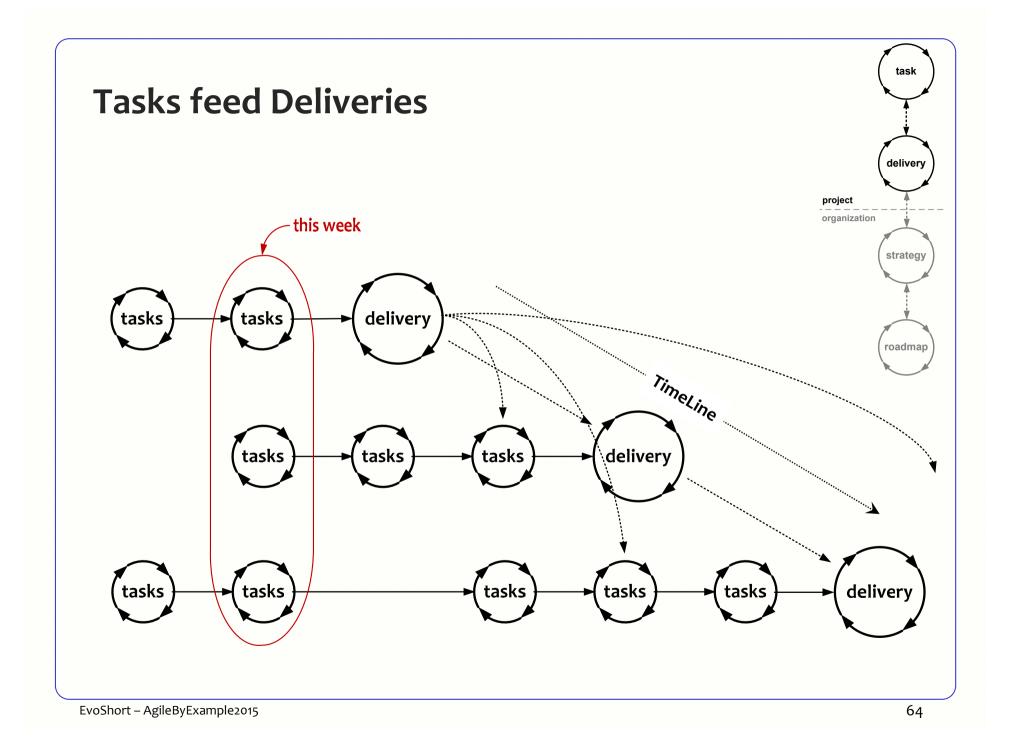

Do you demo at the end of a Sprint ?

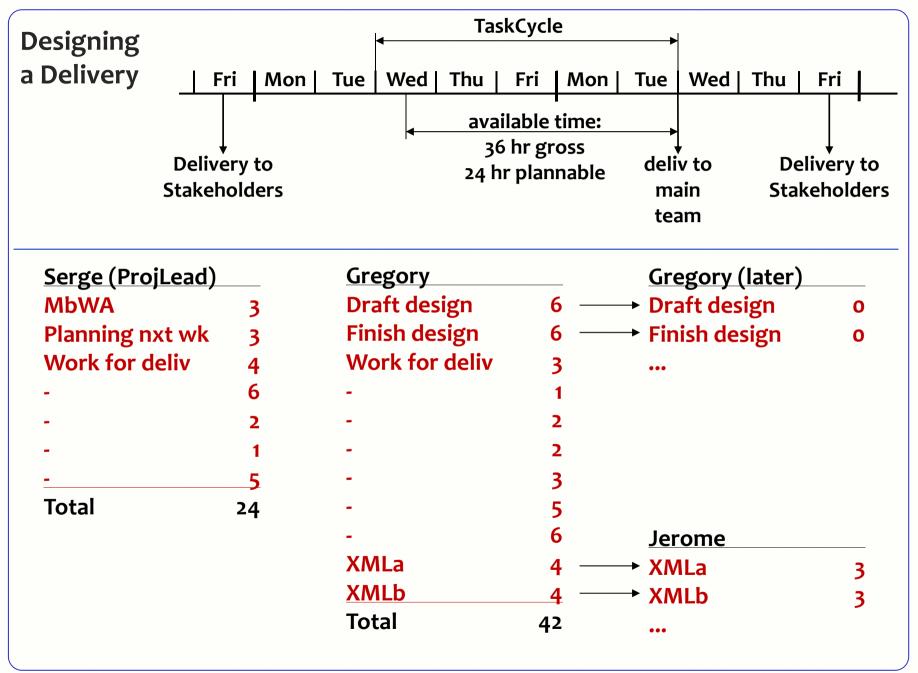

- Give the delivery to the stakeholders
- Keep your hands handcuffed on your back
- Keep your mouth shut
- and o-b-s-e-r-v-e what happens
- Seeing what the stakeholders actually do provides so much better feedback
- Then we can 'talk business' with the stakeholders
- Is this what you do ?
- Success criterion: "No Questions, No Issues"

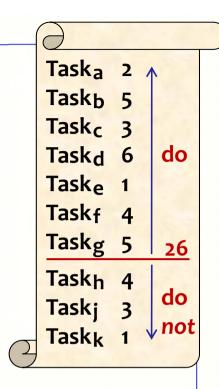

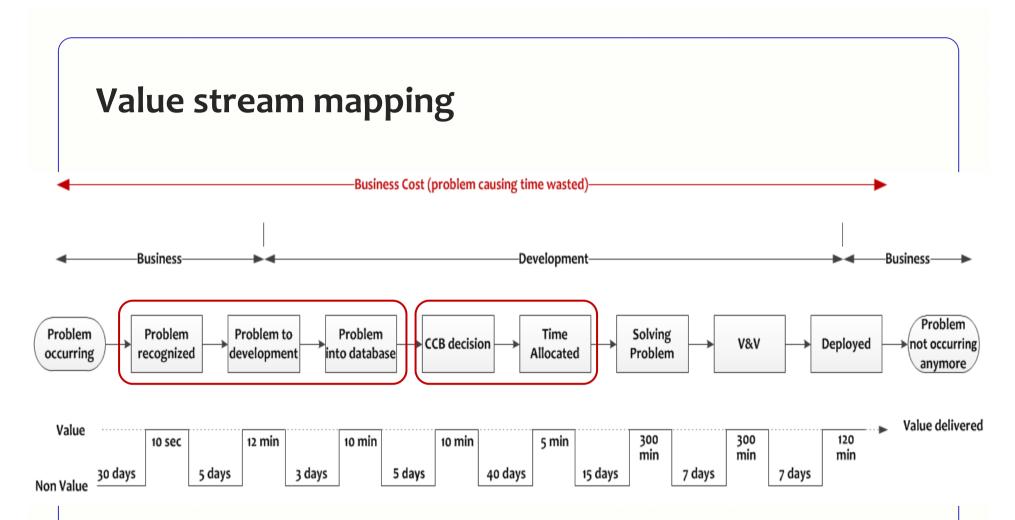

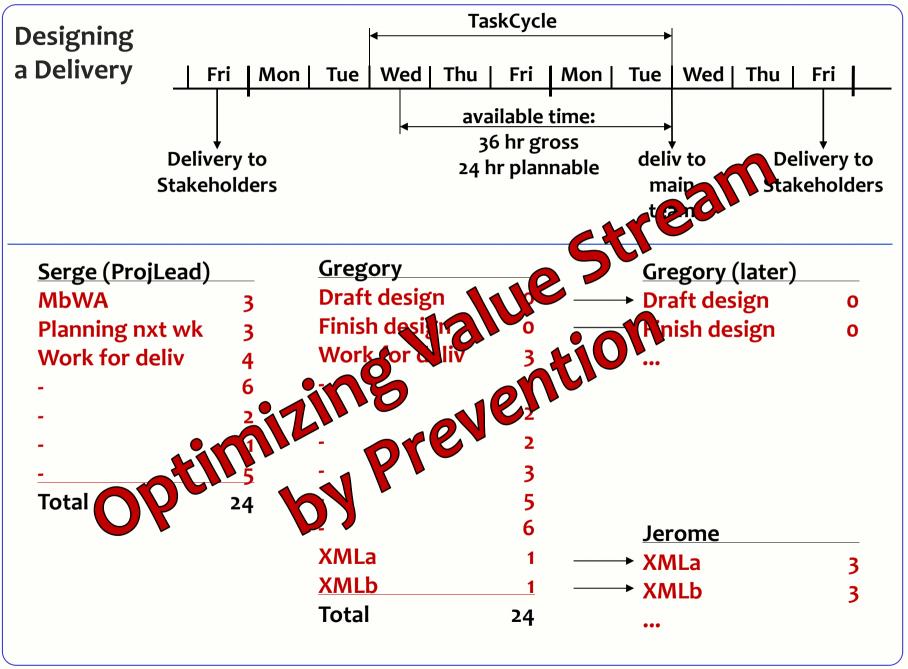

- How much time do you have available
- 2/3 of available time is net plannable time
- What is most important to do (update your list)
- Estimate effort needed to do these things
- Which most important things fit in the net available time (default 26 hr)
- What can you do, and what are you going to do
- What are you not going to do
- Why?

- Total Business Cost 114 days, Cost of Non Value: 112 days
- Occurrence: 2 x per day, delay per occurrence: 10 min
- Number of business people affected: 100
- Business Cost of Non Value: 2 x 10 min x 112 days x 100 people x 400 €/day = 187 k€
- Net Cost of Value: 1.6 days → ~3 people x 1.6 days x 800 €/day = 5 k€

#### Why is this important?

- Half (±30%) of what people do in projects later proves not having been necessary
- During the TaskCycle planning we can very efficiently see
  - What our colleagues think they're going to do
  - Make sure they're going to work on the most important things
  - Not on unnecessary things
  - In line with the architecture and design
  - Leading most efficiently to the goal of the delivery
- We'll see two cases where the architect led the project to success in record time

### **Earth Observation Satellite**

- UN-OBM Telescope UVIS Nedr Battle Sun Bafte Sun Bafte UVIS Defectope Defecto
- Very experienced Systems Engineers
- They use quantified requirements routinely
- They don't know exactly where they'll end up
- 10 year pure waterfall project (imposed by ESA)
- Only problem: They missed all deadlines
- 9 weeks later: They haven't missed any deadline since
- Recently: delivered 1 day early (instead of 1 year late)
- Savings: some 40 man-year
- How did they do that ?

### **Requirements weren't the problem**

- Requirements for tropospheric O3
  - Ground-pixel size : 20 × 20 km2 (threshold); 5 × 5 km2 (target)
  - Uncertainty in column : altitude-dependent
  - Coverage:global
  - Frequency of observation : daily (threshold); multiple observations per day (target)
- Requirements for stratospheric O3
  - Ground-pixel size : 40 × 40 km2 (threshold); 20 × 20 km2 (target)
  - Uncertainty in column : altitude-dependent
  - Coverage:global
  - Frequency of observation :
    - daily (threshold); multiple observations per day (target)
- Requirements for total O3
  - Ground-pixel size : 10 × 10 km2 (threshold); 5 × 5 km2 (target)
  - Uncertainty in column : 2%
  - Coverage:global
  - Frequency of observation :

daily (threshold); multiple observations per day (target)

#### Awful schedule pressure !

- Meeting with sub-contractors in three weeks
- Many documents to review
- Impossible deadline
- How many documents to review ?
- How much time per document?

|          | hr    |    |  |  |  |
|----------|-------|----|--|--|--|
| 4 heavy  | 15    | 60 |  |  |  |

# Developing a new oscilloscope

- 4 teams of 10 people, 8 more people in Bangalore
- Introduced first in one team
- Other teams followed once convinced
- One team lagged because fear of 'micro-management'
- Even if we would drop all you suggested, the 1-on-1's will be kept, because so powerful:
  - We used to do something and afterwards found out it wasn't what it should be
  - Now we find out before, allowing us to do it more right the first time

### Results

- Schedule accuracy for this platform development was 50% better than the program average (as measured by program schedule overrun) over the last 5 years
- This product was the fastest time-to-market with the highest quality at introduction of any platform in our group in more than 10 years
- The team also won a prestigious Team Award as part of the company's Technical Excellence recognition program

www.malotaux.nl/doc.php?id=19 chapter 4.7.1, page 70

# **Quality on Time**

- Evo development gradually delivers function and performance, while eating up resources
- Not just what to deliver, but also how we are going to deliver it and whether this is the right way to deliver it
- EvoPlanning prevents a lot of bad implementations before they are implemented, saving a lot of time

Now we are already much more efficient

- Organizing the work in very short cycles
- Making sure we are doing the right things
- Doing the right things right
- Continuously optimizing (what not to do)
- So, we already work more efficiently

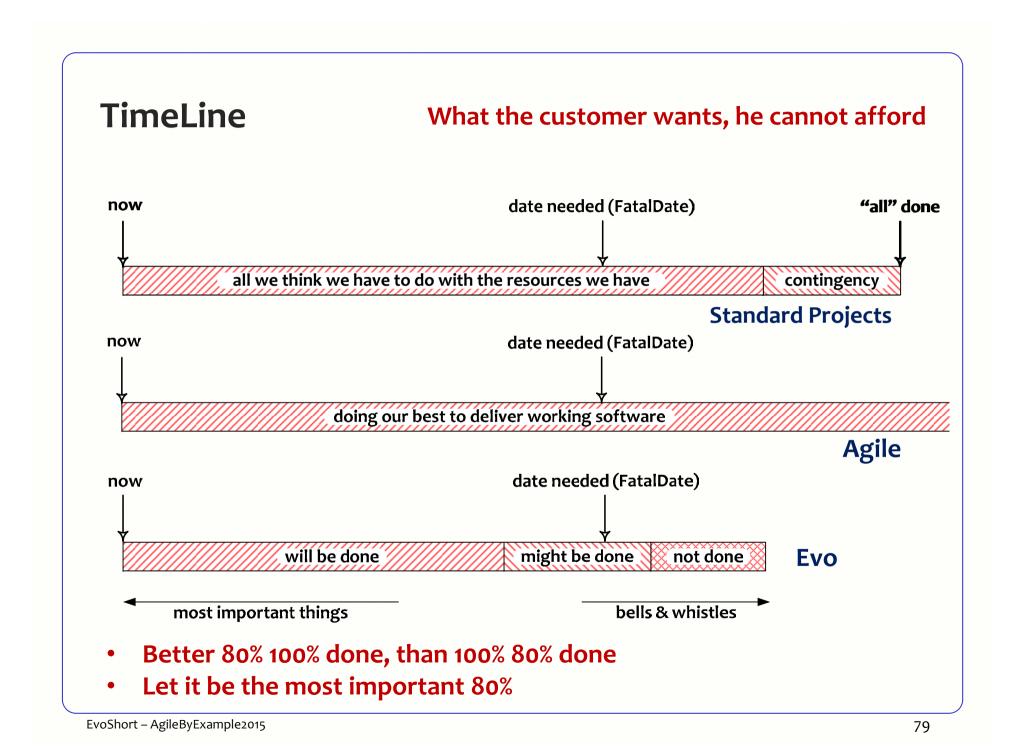

### but ...

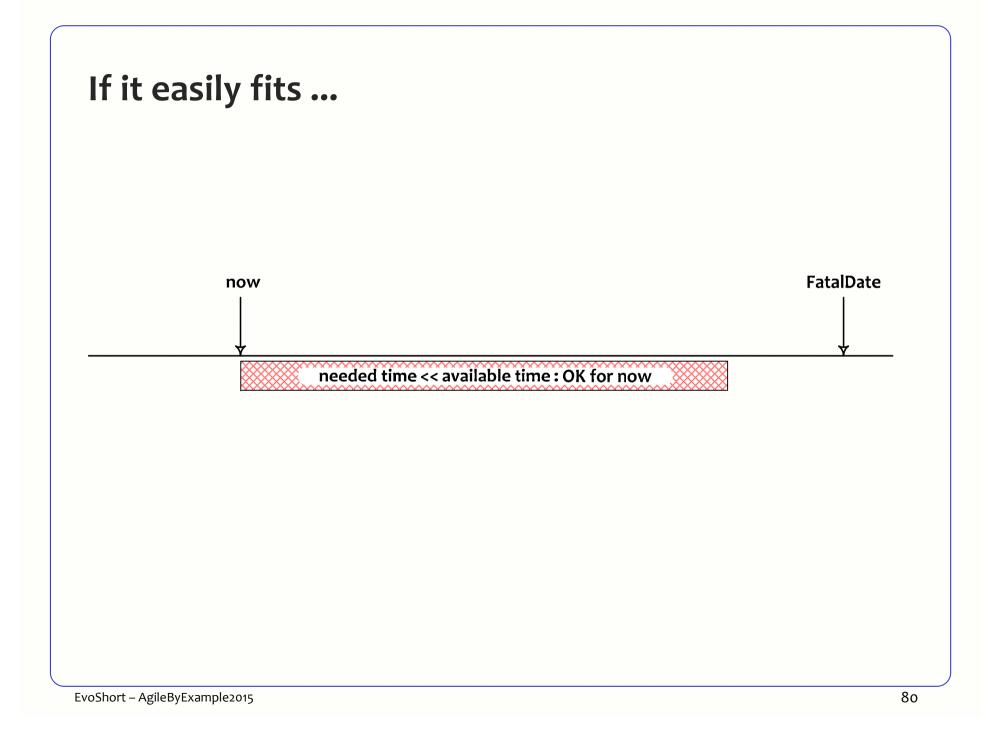

• How do we make sure the whole project is done on time ?

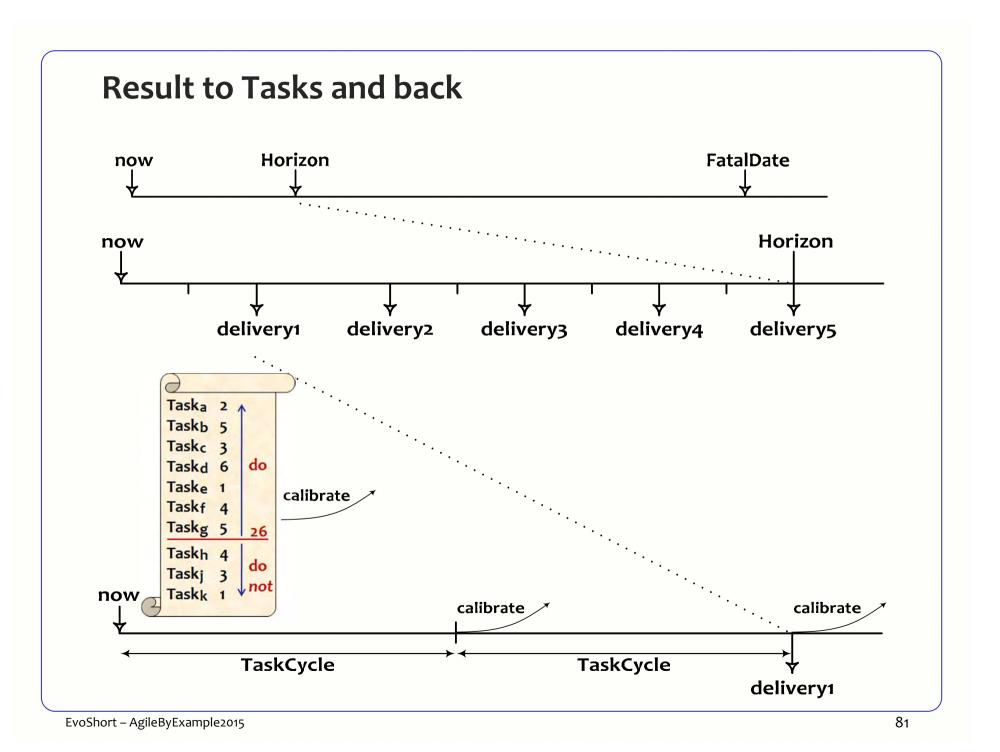

# TimeLine

How to make sure we get

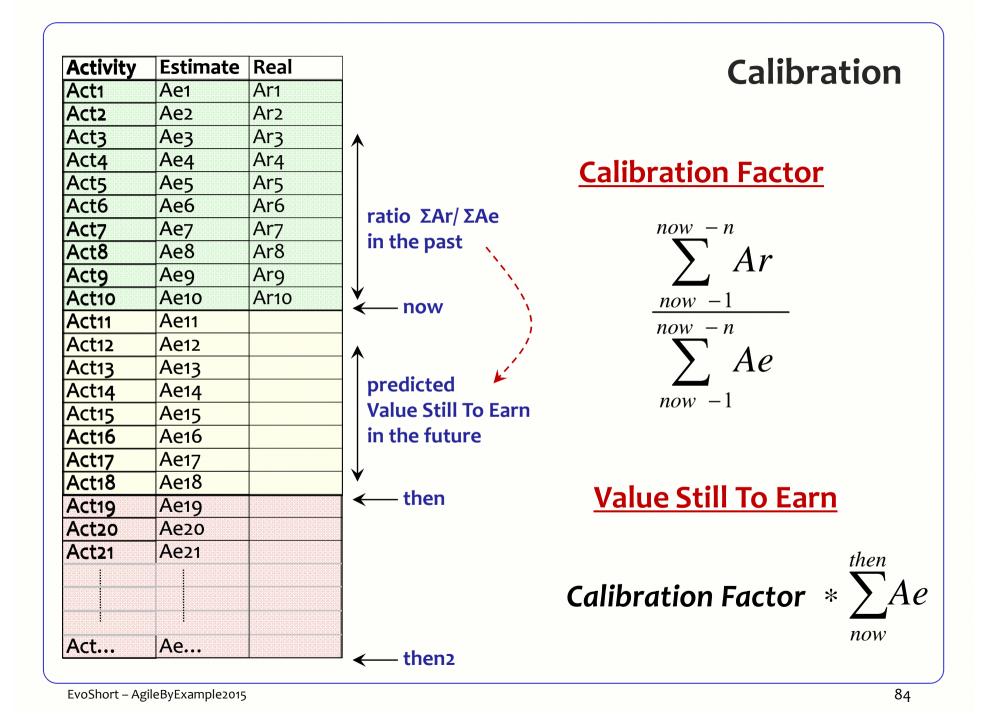

the Right Results at the Right Time

#### • Starting deadline

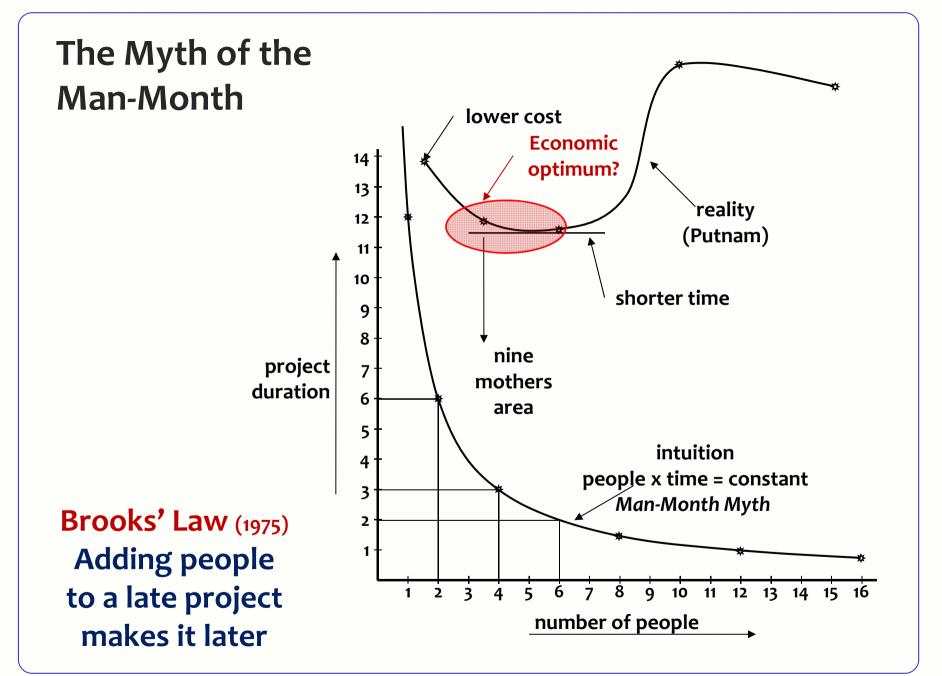

- Last day to start not to delay the finish deadline
- Every day we start later, we will cause delay

### **Deceptive options**

- Hoping for the best (fatalistic)
- Going for it (macho)
- Working overtime (fooling ourselves)
- Moving the deadline
  - Parkinson's Law
    - Work expands to fill the time for its completion
  - Student Syndrome
    - Starting as late as possible, only when the pressure of the FatalDate is really felt

### Intuition often guides us into the wrong direction

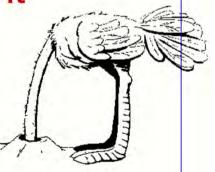

Continuous elimination of waste

We don't have enough time, but we can save time without negatively affecting the Result !

- Efficiency in what (why, for whom) we do doing the right things
  - Not doing what later proves to be superfluous
- Efficiency in how we do it doing things differently
  - The product
    - Using proper and most efficient solution, instead of the solution we always used
  - The project
    - Doing the same in less time, instead of immediately doing it the way we always did
  - Continuous improvement and prevention processes
    - Constantly learning doing things better and overcoming bad tendencies
- Efficiency in when we do it right time, in the right order
- TimeBoxing much more efficient than FeatureBoxing

# TimeLine

- The TimeLine technique doesn't solve our problems
- It helps to expose the real status early and continuously
- Instead of accepting the undesired outcome, we do something about it
- The earlier we know, the more we can do about it
- We start saving time from the very beginning
- We can save a lot of time in any project, while producing a better outcome

### If, and only if, we are serious about time !

# Some extra

# (we won't have time for)

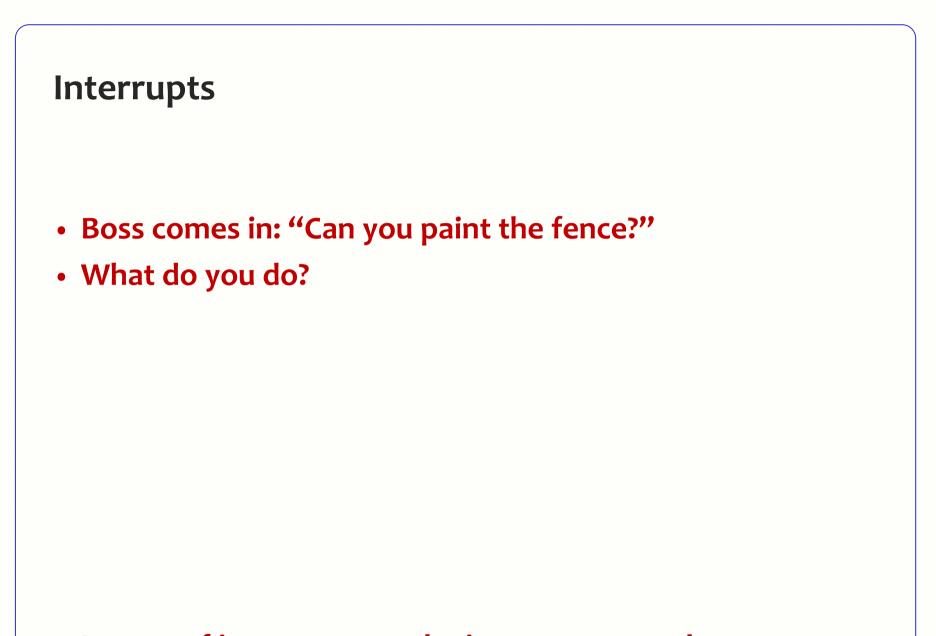

# **Active Synchronization**

Somewhere around you, there is the bad world. If you are waiting for a result outside your control, there are three possible cases:

- 1. You are sure they'll deliver Quality On Time
- 2. You are not sure
- 3. You are sure they'll not deliver Quality On Time
- If you are not sure (case 2), better assume case 3
- From other Evo projects you should expect case 1
- Evo suppliers behave like case 1

#### In cases 2 and 3: Actively Synchronize: Go there !

- 1. Showing up increases your priority
- 2. You can resolve issues which otherwise would delay delivery
- 3. If they are really late, you'll know much earlier

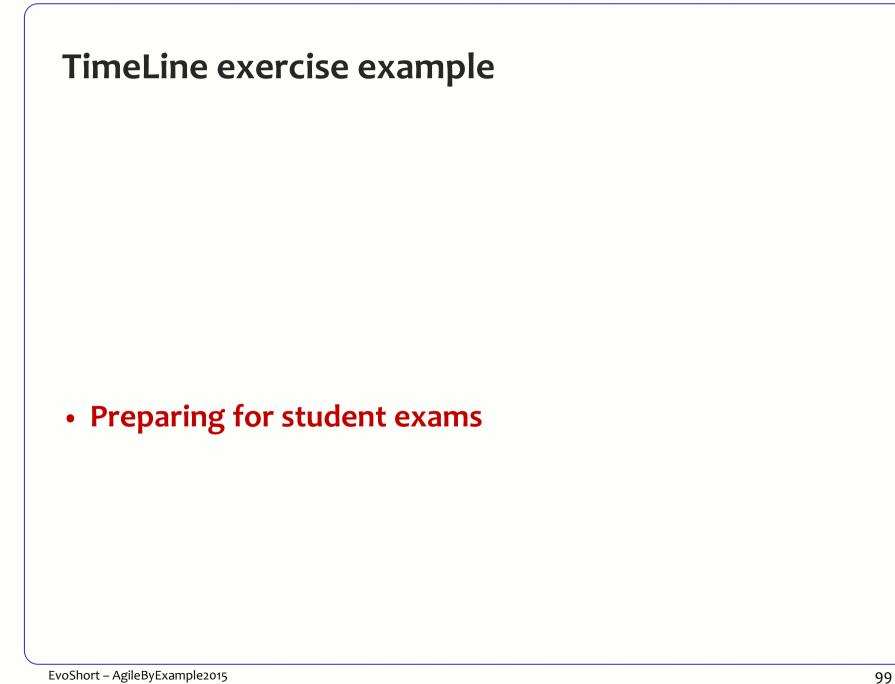

### • In case of interrupt, use the interrupt procedure

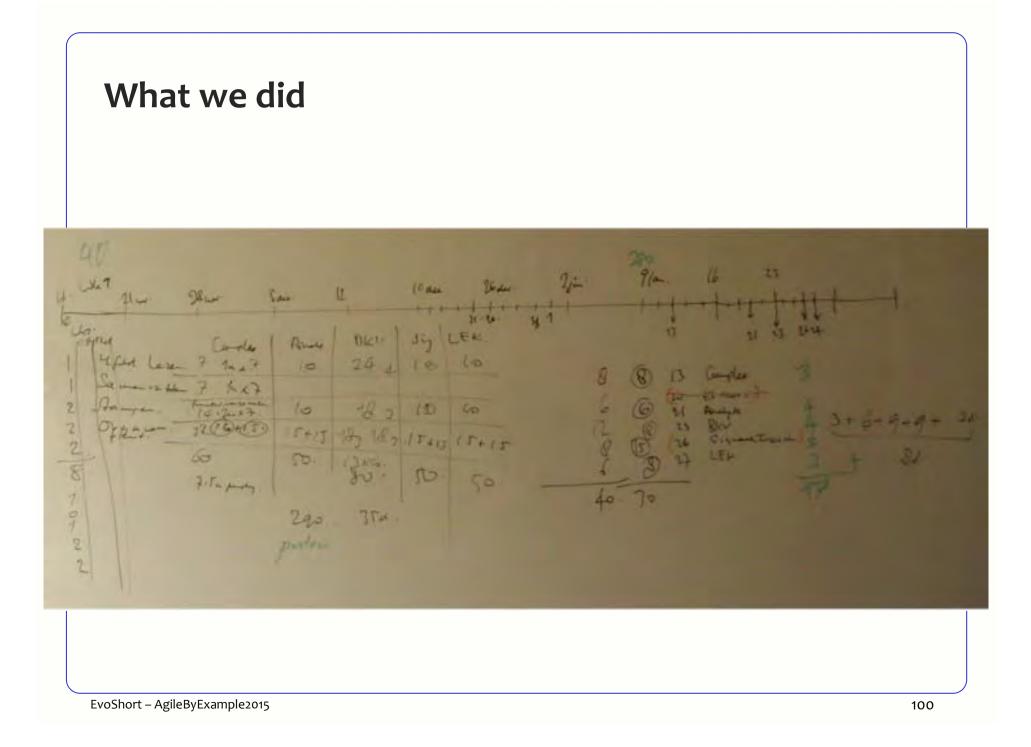

### **Interrupt Procedure** "We shall work only on planned Tasks"

In case a new task suddenly appears in the middle of a Task Cycle (we call this an Interrupt) we follow this procedure:

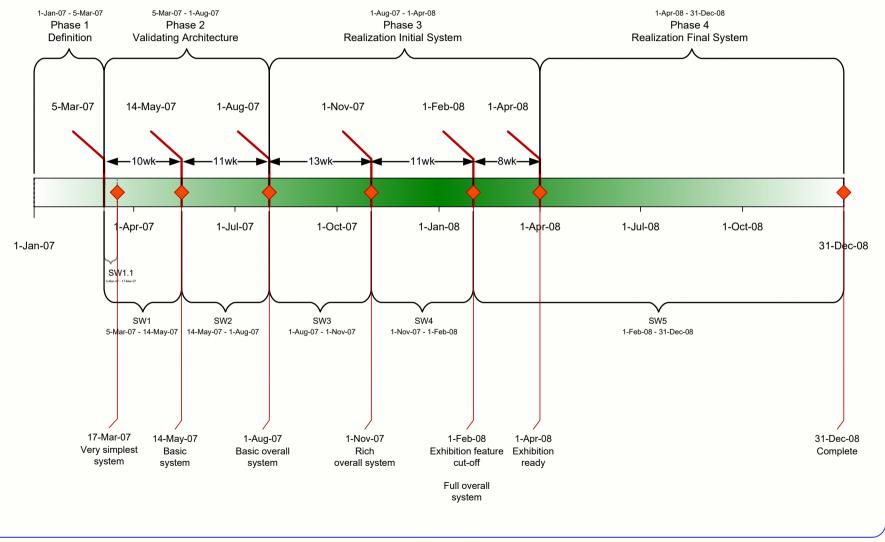

- 1. Define the expected Results of the new Task properly
- 2. Estimate the time needed to perform the new Task, to the level of detail really needed
- 3. Go to your task planning tool (many projects use the ETA tool)
- 4. Decide which of the planned Tasks is/are going to be sacrificed (up to the number of hours needed for the new Task)
- Weigh the priorities of the new Task against the Task(s) to be sacrificed
- 6. Decide which is more important
- 7. If the new Task is more important: replan accordingly
- 8. I the new Task is not more important, then do not replan and do not work on the new Task. Of course the new Task may be added to the Candidate Task List
- 9. Now we are still working on planned Tasks.

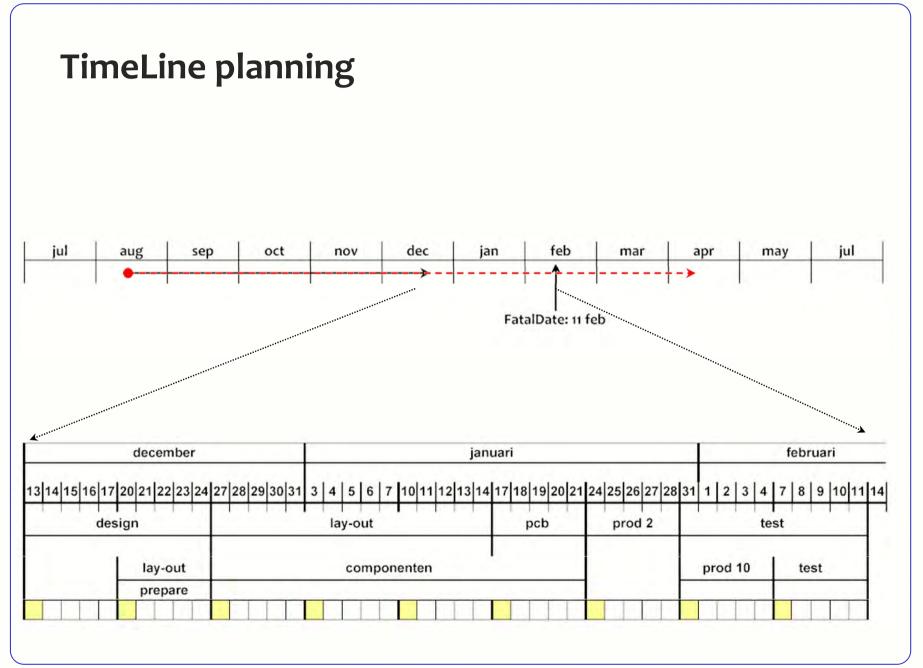

\*

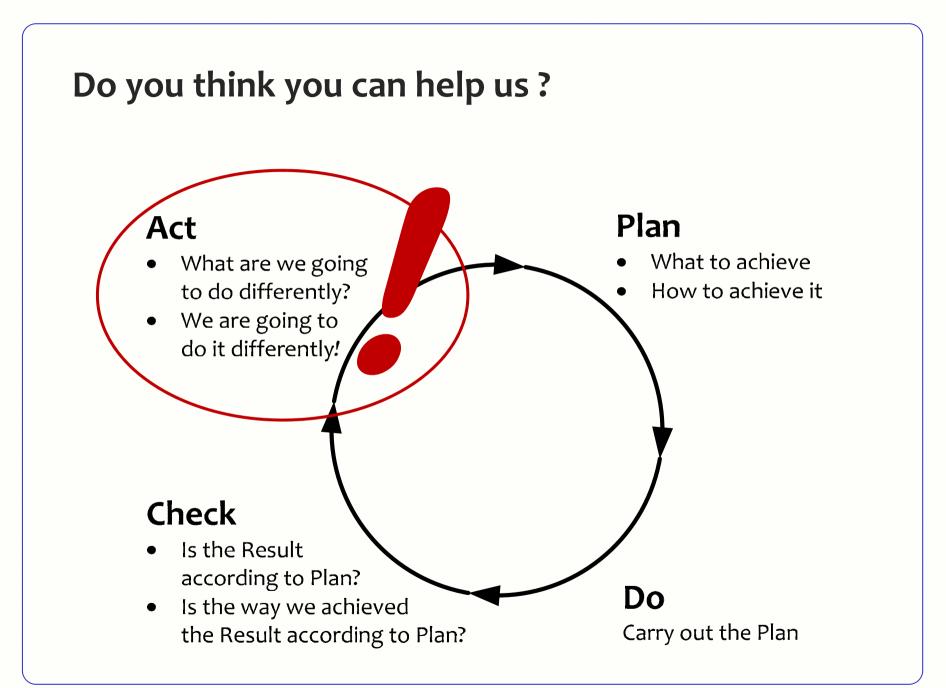

### TimeLine example

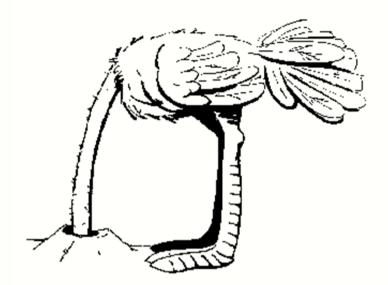

# Help ! We have a QA problem !

- Large stockpile of modules to test (hardware, firmware, software)
- You shall do Full Regression Tests
- Full Regression Tests take about 15 days each
- Too few testers ("Should we hire more testers ?")
- Senior Tester paralyzed
- Can we do something about this?

# In stead of complaining about a problem ...

(Stuck in the Check-phase)

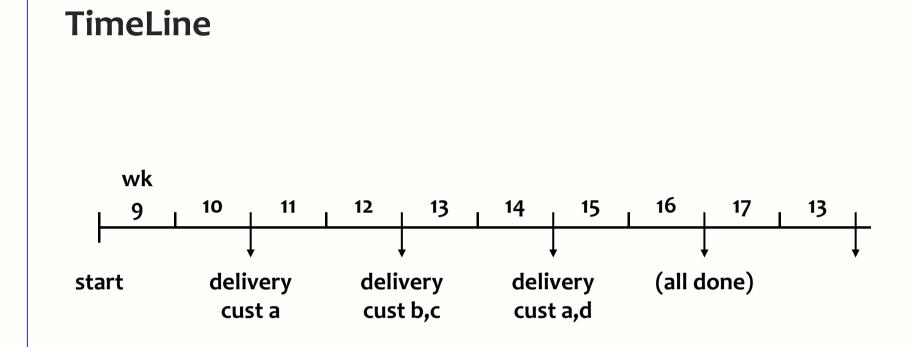

# Let's do something about it !

(Moving to the Act-phase)

# Objectifying and quantifying the problem is a first step to the solution

### Selecting the priority order of customers to be served

- "We'll have a solution at that date ... Will you be ready for it ?" An other customer could be more eagerly waiting
- Most promising customers

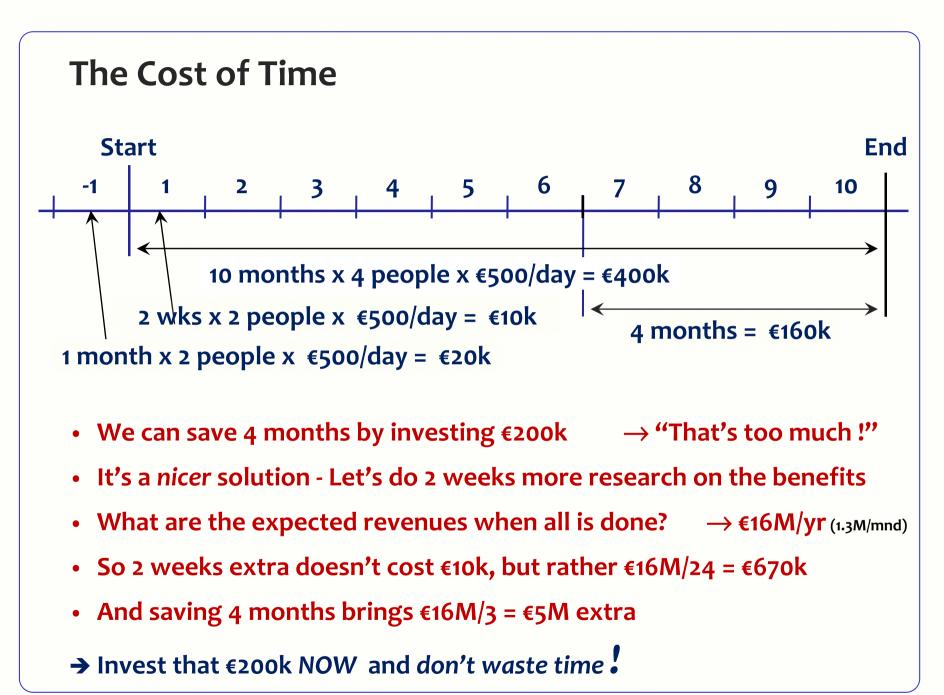

### Result

- Tester empowered
- Done in 9 weeks
- So called "Full Regression Testing" was redesigned
- Customers systematically happy and amazed
- Kept up with development ever since
- Increased revenue
- **Recently:**
- Tester promoted to product manager
- Still coaching successors how to plan

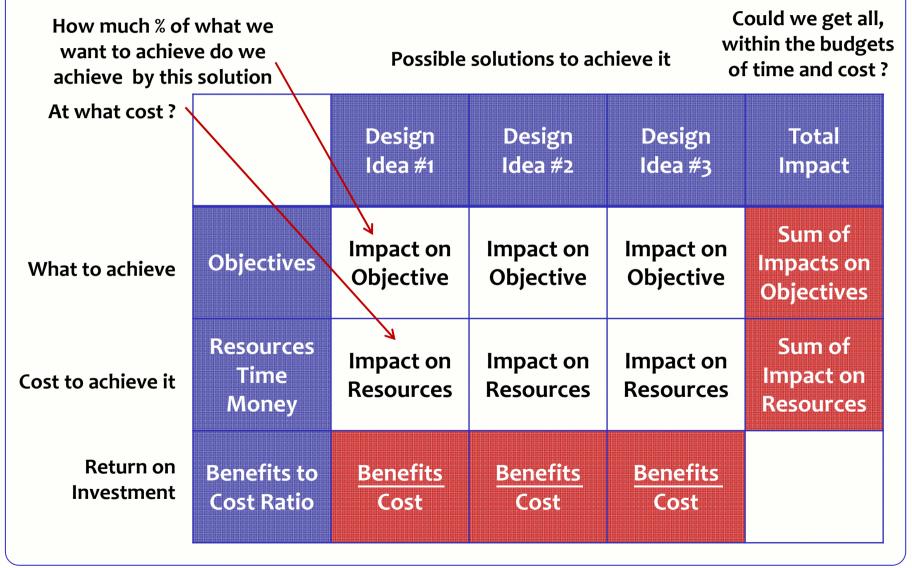

The problems in projects are not the real problem, the real problem is that we don't do something about it

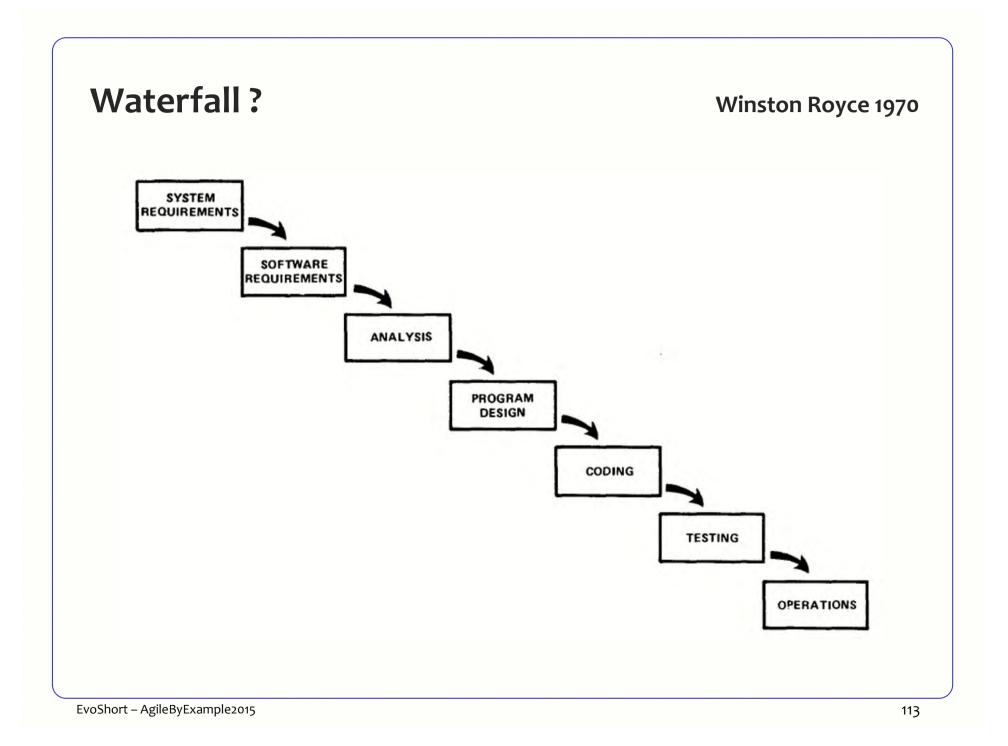

Doing retrospectives does not solve the problem ! Prespectives save a lot of time

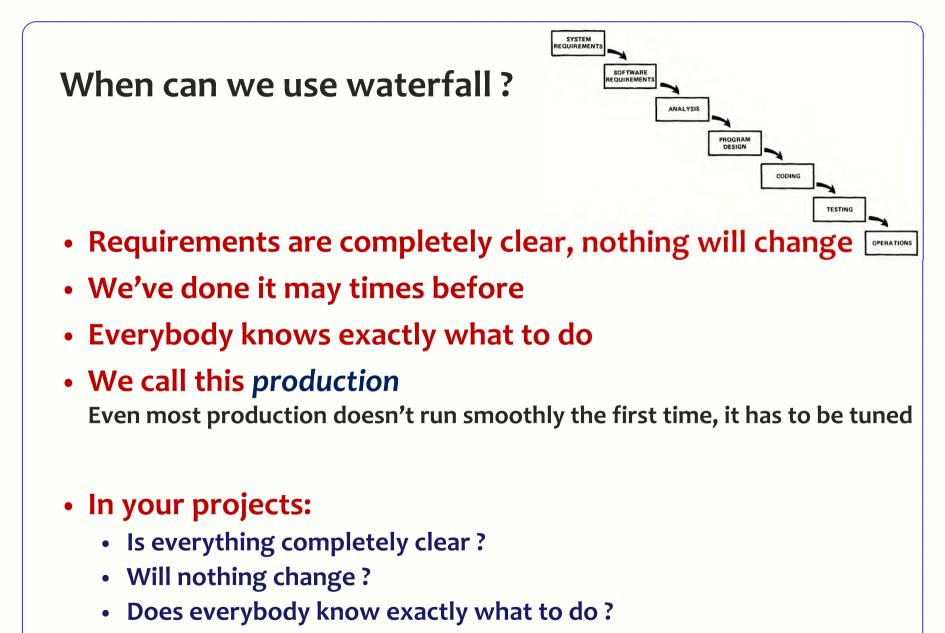

### **Impact Estimation principle**

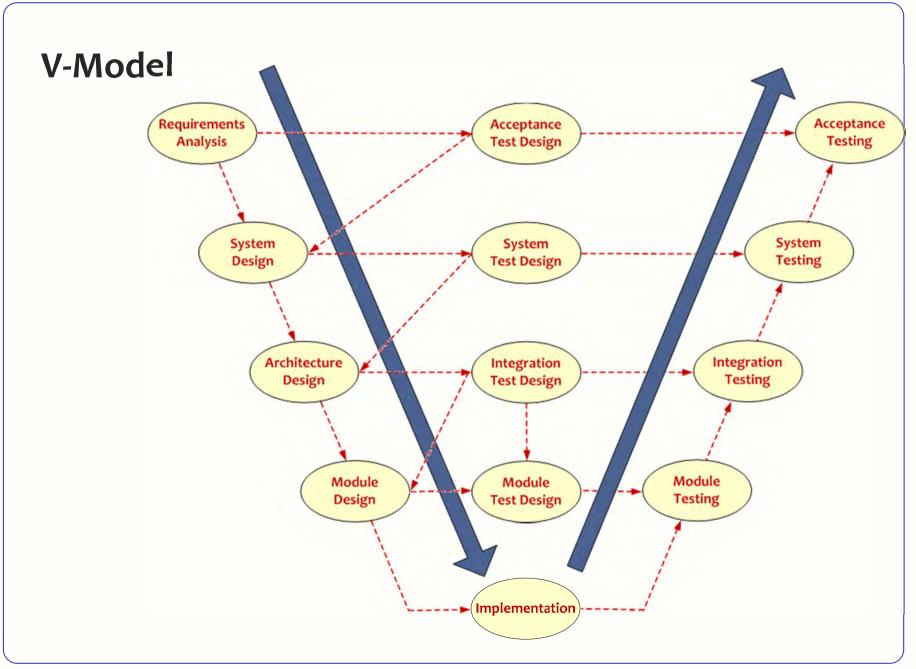

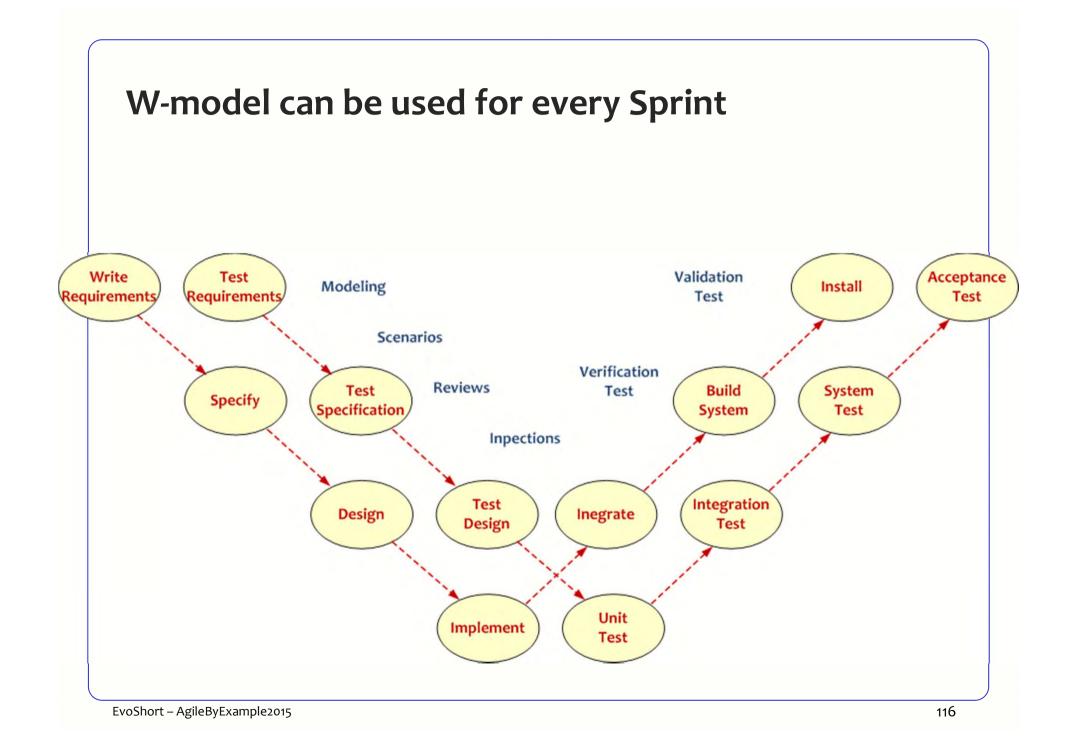

# Project Life Cycles

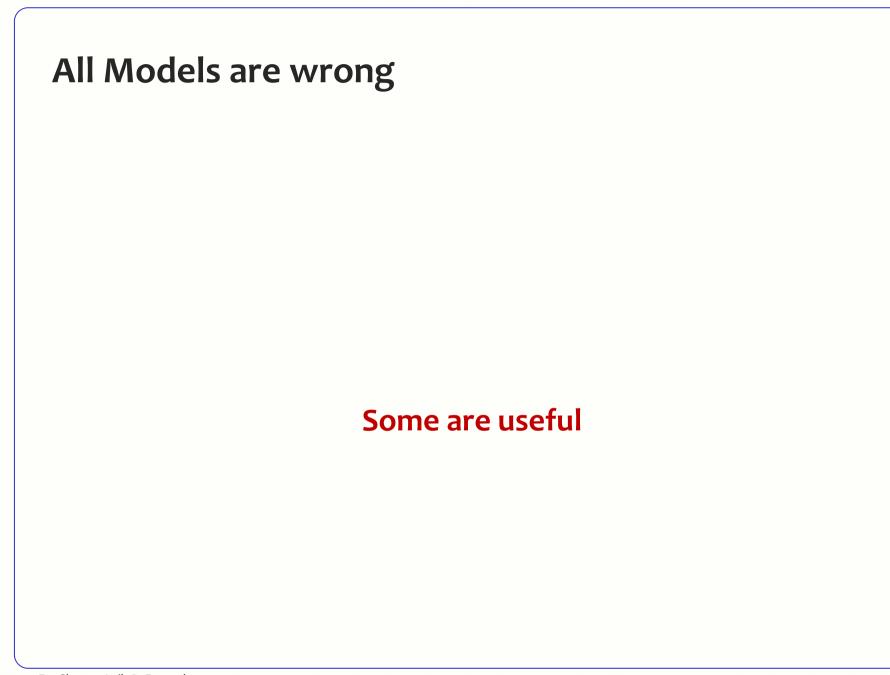

• Are you sure ?

# Agile or agile ?

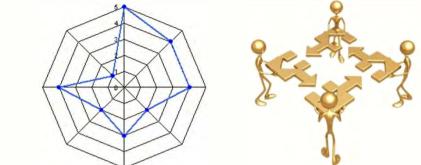

EvoShort – AgileByExample2015

### What is Agile ?

• A philosophy (Agile Manifesto)

We are uncovering better ways of developing software by doing it and helping others do it

Through this work we have come to value:

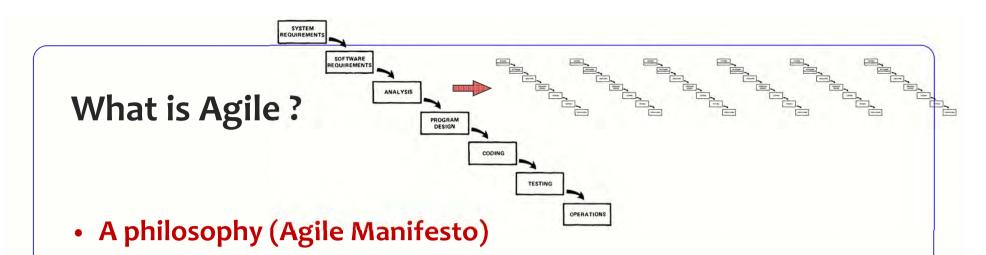

- Individuals and interactions over processes and tools
- Working software over comprehensive documentation
- Customer collaboration over contract negotiation
- Responding to change over following a plan

That is, while there is value in the items on the right, we value the items on the left more

### From the Principles behind the Agile Manifesto

- Our highest priority is to satisfy the customer through early and continuous delivery of valuable software Software is always part of a system
- We welcome changing requirements, even late in development If requirements have to change, let's *provoke* requirements change as quickly as possible
- We deliver working software frequently;
   Working software is the primary measure of progress
   What we deliver simply works.
   If the working software doesn't do what it should, is that a measure of progress?
- Business people and developers must work together daily Do they? Should they? Daily?
- Simplicity the art of maximizing the amount of work not done The art of not doing what is superfluous ! Why make it complex if we can keep it simple ?
- At regular intervals, the team reflects on how to become more effective, then tunes and adjusts its behaviour accordingly

Not just retrospectives, but even more importantly: prespectives

- agile = ability to move quick, easy and adaptable
- Short iterations not one Waterfall
- Delivering value (do we measure progress towards real value ?)
- **Retrospectives** (retrospectives on retrospectives: did it really work ?)
- Not a standard: You can make of it whatever you want
- XP focus on software development techniques
- Scrum very basic short term organization of development
- Are you agile if you religiously focus on a 'method'?

### The past was already ahead

- Managing the development of large software systems Winston Royce 1970
  - Famous 'Waterfall document': figure 2 showed a 'waterfall'
  - Text and other figures showed that Waterfall doesn't work
  - Anyone promoting Waterfall doesn't know or didn't learn from history
- Cleanroom software engineering Harlan Mills 1970's
  - Incremental Development Short Iterations
  - Defect prevention rather than defect removal
  - Inspections to feed prevention
  - No unit tests needed
  - Statistical testing
  - If final tests fail: no repair start over again
  - 10-times less defects at lower cost
  - Quality is cheaper
- Evolutionary Delivery Evo Tom Gilb 1974, 1976, 1988, 2005
  - Incremental + Iterative + Learning and consequent adaptation
  - Fast and Frequent Plan-Do-Check-Act
  - Quantifying Requirements Real Requirements
  - Defect prevention rather than defect removal

Programming

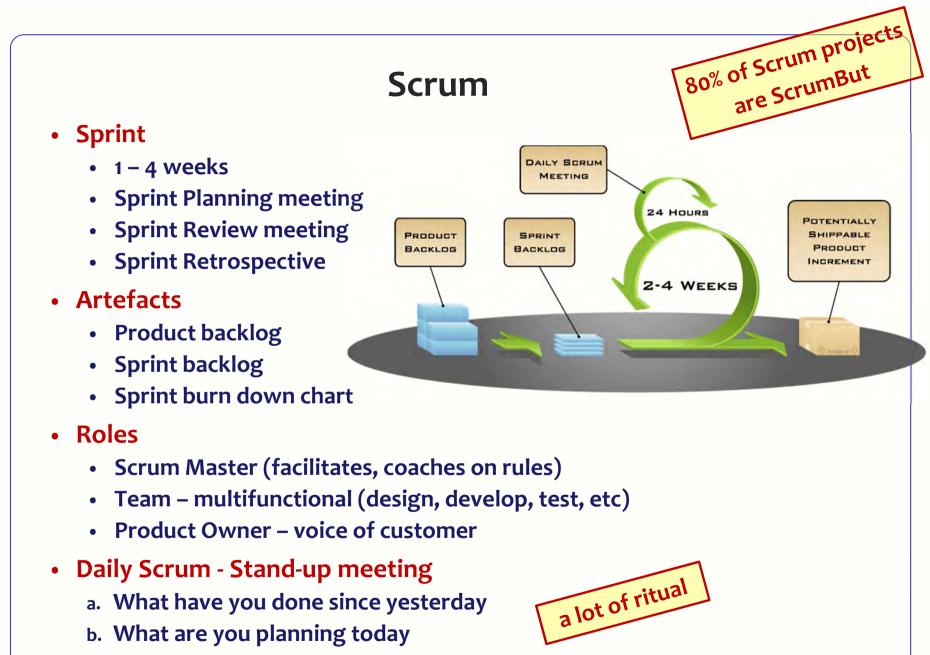

OPERATIONS

### **XP – eXtreme Programming**

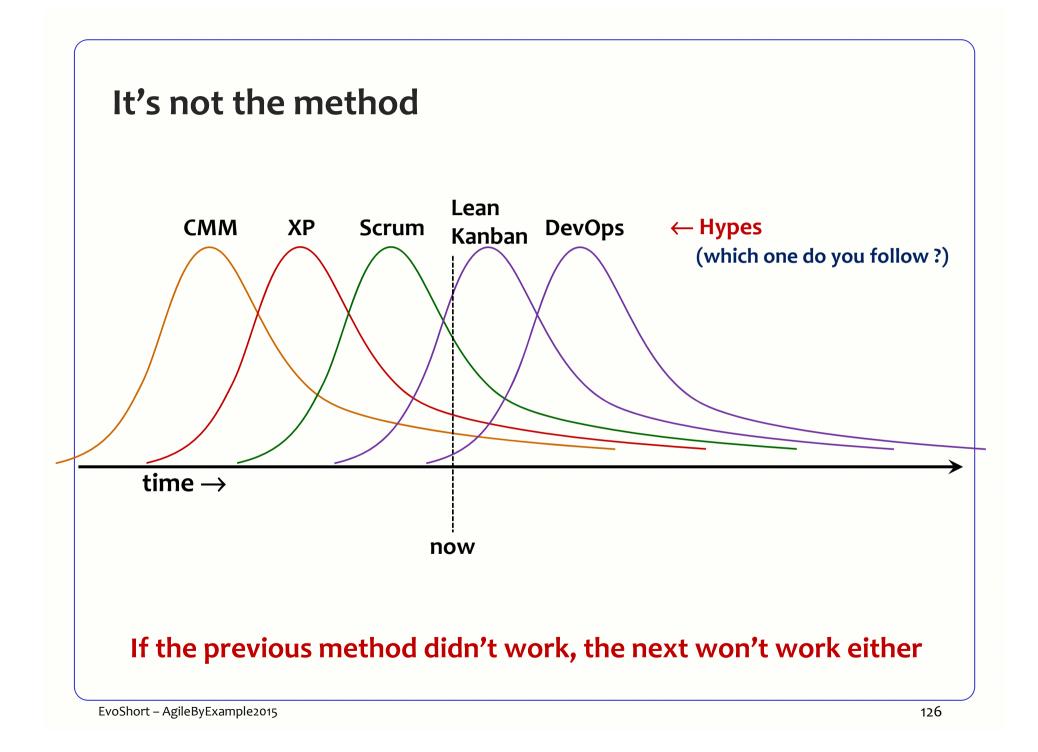

- Planning Game
- Metaphor
- Simple Design
- Testing (TDD)
- Refactoring
- Coding standards

- Small releases
- Pair programming
- Collective Ownership
- Continuous integration
- 40-hour week
- On-site customer

## Original project was not successful as soon as the writer of the book left the project

c. Impediments limiting achieving your goals?

### What's usually missing in Agile ?

#### **Stakeholder Focus**

- Real projects have dozens of stakeholders
  - Not just a customer in the room, not just a user with a use case or story

### **Results Focus**

• It is not about programming, it is about making systems work, for real people

### **Systems Focus**

- It is not about coding, but rather: reuse, data, hardware, training, motivation, sub-contracting, outsourcing, help lines, user documentation, user interfaces, security, etc.
- So, a systems engineering scope is necessary to deliver results
- Systems Engineering needs quantified performance and quality objectives

### Planning

- Retrospectives within the Sprint
- Retrospectives of retrospectives
- Planning what not to  $do \rightarrow preflection$
- Overall planning and prediction: when will what be done

**Ref Niels Malotaux**
